Problem Description

- Identification of duplicate questions.
- A page for each logically distinct question.
- Classification Problem
- Supervised Learning
- P << n, then most models can be used.
- A ‘scalable question platform’ should provide answers to each distinct question in a single resource location. This will enhance proper resources utilization.

Data Exploration - Word Cloud

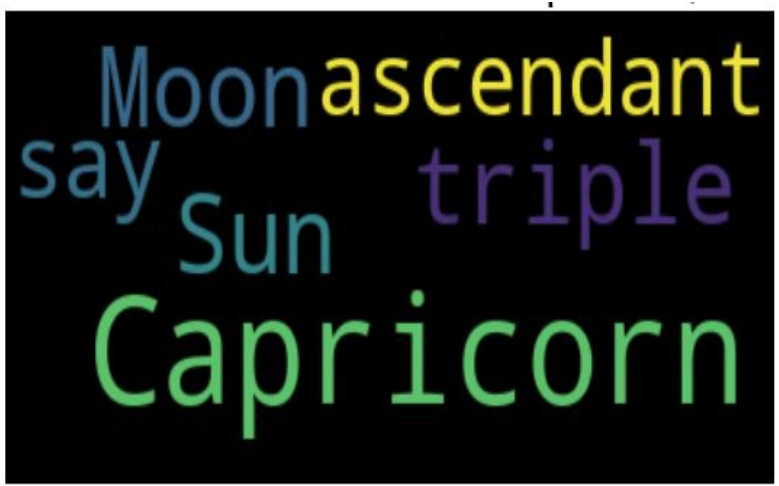
What is the step by **step** **guide** to **invest** in **share** **market** in **india**?

What is the **step** by step **guide** to **invest** in **share** **market**?

Data Exploration - Word Cloud

Astrology: I am a **Capricorn** **Sun** Cap **moon** and **cap** **rising**...what does that **say** about me?

I'm a **triple** **Capricorn** (**Sun**, **Moon** and **ascendant** in Capricorn) What does this **say** about me?



Data Exploration

Parameter Tuning

- Cross-validation or GridSearch would also be used to select best model parameters.

- Given the imbalance in the frequency distribution of response predictor, it might be suggested to use stratified random sampling method during CV.

Solution Methodology & Implementation

- Methodology:
  - Automate the process of detecting semantically equivalent questions.
  - Direct a user to an existing resource/page if the question already exist.
- Implementation:
  - Build effective and scalable machine learning and natural learning processing models.
  - Data preprocessing.
  - Models building & Parameters tuning.
  - Models Validation.
  - Interface a scalable, online real-time RESTful API with the best model.
  - Load balance the API in order to minimize response time and to avoid overload.

Environment Setup

- Development
  - Build the models on the train set.
  - Use test set for models validation.
  - Interface a Flask RESTful API with the best model.
- Production
  - Move the best model and its optimal parameters to production.
  - Interface a RESTful API with WSGI server with the model parameters.
  - Load balance the API.
  - As more data suffaces, rebuild the model occasionally to improve predictability.
